

What it is

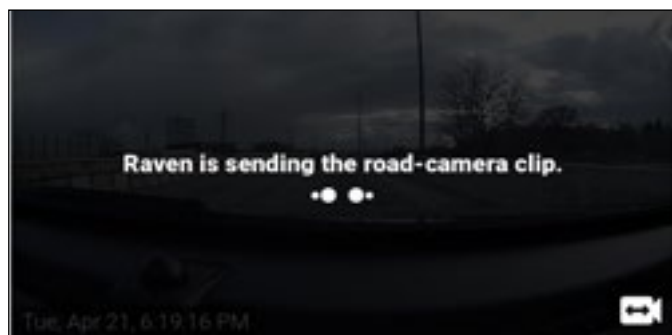

Cloud video enables remote video downloads from the Raven device. Raven detects several events from engine start to possible impact and creates short video clips of each one to be accessible remotely from the web app.

Playing remote event videos in the Raven Dashboard.

How it works

Raven's LTE connection enables it to communicate with the cloud. When the internal sensors on Raven detect dangerous driving or an impact, the device marks five seconds before the event and five afterward. If the event is critical, Raven pushes it up to the cloud immediately. For all other events, the option to upload to the cloud is available.

Requesting non-critical event video, takes only seconds.

How to use it

1. From the Raven Connected web app open the details panel.
2. Beside the event you'd like to watch or save, select the 'play' icon.
3. An opaque icon means that the video is already in the cloud
4. A transparent icon indicates that the video is available for remote download from the Raven.
5. To download the footage: from the video feed, in the bottom right corner select the download icon.
6. Cloud video clips can also be accessed anytime in the 'History' tab.

Cloud Video Events List

- Aggressive Acceleration
- Car movement
- Driver detected
- Engine on/Parked
- Geofence Entered
- Gesture Triggered
- Harsh Braking
- Harsh Cornering
- Idling
- Potential Impact
- Raven unplugged
- Speeding
